

DSMETER

Your solution for automated security compliance, auditing, alerting, and control for eDirectory, NDS and NetWare File Systems

Using DSMETER's NLM-based technology you can:

- Track eDir/LDAP/NDS logins and logouts
 - Capture failed login attempts
- Alert on eDirectory replica errors
 - Detect file/folder actions
 - Prohibit file/folder actions
- Alert disk space restrictions — users and folders
- Track eDir/NDS account actions
- Restrict eDir/NDS object creation by object class
- Uncover hidden eDir/NDS objects
- Alerting by email & NetWare popup
 - And, much more!

DSMETER

Your solution for automated security compliance, auditing, alerting, and control for eDirectory, NDS and NetWare File Systems

DSMETER's NLM-based Technology enables:

- **Track eDir/LDAP/NDS logins and logouts**

Audit login and logout activity for your entire Tree. You can refine tracking to be by specific container or container branch membership. Track LDAP Authentications such as those used during GroupWise Logins. Reports indicate total time logged in, the server(s) where authentication occurred and the workstation IP address used.

- **Capture failed login attempts**

Find out what eDir/NDS and Bindery accounts have attempted to login with a bad password. You will also discover login attempts that are being issued for accounts that do not exist including the login name specified. You can even be alerted immediately if an account becomes locked due to Intruder Lockout!

- **Alert on eDirectory replica errors**

Receive alerts of eDirectory replica errors, including stuck obituaries, hung login scripts, synchronization/time errors, transitory errors and more. Each replica on the server is tracked individually. Know when your eDirectory's health is compromised.

- **Detect file/folder actions**

[For NetWare File Systems] Monitor File Create, Copy, Delete, Open, Write, Read, Salvage and Purge actions. Scope tracking to where you need it. Tracking options include: by server, volume, directory, file, file extension and use of wildcards with any of these options. Exclude collection of unwanted actions. Know who did what, where, when and even their workstation address. Email and NetWare popup alerts are available.

- **Prohibit file/folder actions**

[For NetWare File Systems] Protect all EXE files from accidental, intentional or viral modification. Deny unauthorized application installations. Deny creation and/or modification of files based upon any criteria you specify. Now you can block creation of any file type such as MP3s. Email and NetWare popup alerts are available.

- **Track eDir/NDS account actions**

Discover all accounts where Supervisory privileges are being granted including existing accounts that are being elevated with Supervisory privileges. Track selected objects only. All changes to security settings are reportable. All accounts created and deleted can be captured for your entire Tree or for specific container branches. Know when accounts are enabled or disabled. Full eDir/NDS attribute tracking is also included. Email and NetWare alerts are available for attribute modifications.

- **Restrict eDir/NDS object creation by object class**

Keep your accounts under control by denying unauthorized account creation and deletion activity by object class. Ordinarily a user with create and delete permission can create and delete an object of any type, this includes server objects, groups, printers, containers, and so on.

- **Uncover hidden eDir/NDS objects**

Schedule scans of your Tree to seek out any hidden objects. Automatically disable login for any hidden user accounts found. Optionally unhide any objects found. Email and NetWare alerts are available.

- **Track and alert on selected NetWare server activity**

Be on top of actions occurring at your NetWare servers. Volume space alerts when volumes are filling up; users running of space per their restricts; folders exhausting space per restrictions. NLMs Loaded and Unloaded. Server Last Reboot, Cache Buffers too low, CPU % exceptions.

- **Administrator alerts**

Receive Email and NetWare popup alerts when Supervisor privileges are granted to your File Systems and/or eDir/NDS. Additionally, alerts can be sent when a wrong password is used to login to eDir/NDS. With DSMETER, you will know how your network is being used at the level of detail you require.

DSMETER version 3 has been designed for use on all Intel/AMD-based NetWare 5.x through NetWare 6.x servers.
